

New Inoculants to Enhance Yield in Soybeans

Early development research has indicated that two new inoculants for soybeans have the potential to increase nitrogen fixation and yield.

PROJECT GOALS:

1. Characterize the level of enhanced nodulation for these new inoculants
2. Determine yield benefit of these inoculants across multiple soils and land forms

WHAT WE NEED FROM YOU:

- Apply in-furrow or hopper box treatments as specified in the plot layout
- Treatments:
 1. No inoculant
 2. Terramax in furrow at 12.8 oz/A
 3. Treated seed with N+ infurrow at 12.8 oz/A
 4. Optional: apply inoculant as hopper box
- Manage crop and provide as-planted and yield monitor data. Harvest strips with the row.

WHAT ISA WILL DO FOR YOU:

We will provide:

- Imagery of the trial field
- A summary of trial results from your farm
- An aggregated data summary for all similar trials combined

Treatment

-  Not Plot
-  No Inoculant
-  AZ product
-  N+ product

Sample Plot Layout:

1. Select a field with high variability in terms of yield, soil types or topography
2. Suggested width of strip is one round of the combine
